### GeORG-Project

In 2008 the EU project started "GeORG" with the idea to establish a tool for space planning of the subsurface along the Upper Rhine Graben.

The geological 3D-model of the Basel region ( $600 \text{ km}^2$ ) is the Swiss contribution to the "GeORG"-project.  
12 geological horizons were modelled during the GeORG-project.

In the Basel area additional 8 horizons were integrated.

- Cenozoic model horizons
- base Unconsolidated Rocks
- base Tüllinger Schichten
- base Elsässer Molasse
- base Foraminiferenmergel Fm.
- base Cenozoic

- Mesozoic / Palaeozoic model horizons
- base Vellerat Fm.
- base St. Ursanne Fm.
- top Hauptrogenstein Fm.
- base Hauptrogenstein Fm.
- base Passwang-Fm.
- base Opalinus-Ton
- base Jurassic (Staffellegg Fm.)
- base Gips-Keuper
- base Keuper
- base Trigodonodus-Dolomite
- top Anhydrite-Group
- base Anhydrite-Group

GeORG-horizons (12) are magenta  
additional horizons (8)  
Basel region green

### 3D spatial planning tool

Instead of a static geological model, it was the aim to establish a tool for subsurface planning in an urban area.

- the tool should be easily adjustable with new data
- the tool should be flexible for local refinements
- the tool should be open for spatial extension

### Development

Step 1: acquisition – analysis – harmonisation of raw data & basic information >> datamanagement

Step 2: Interpretation and 3D-modelling

Step 3: transfer of results into the datamanagement

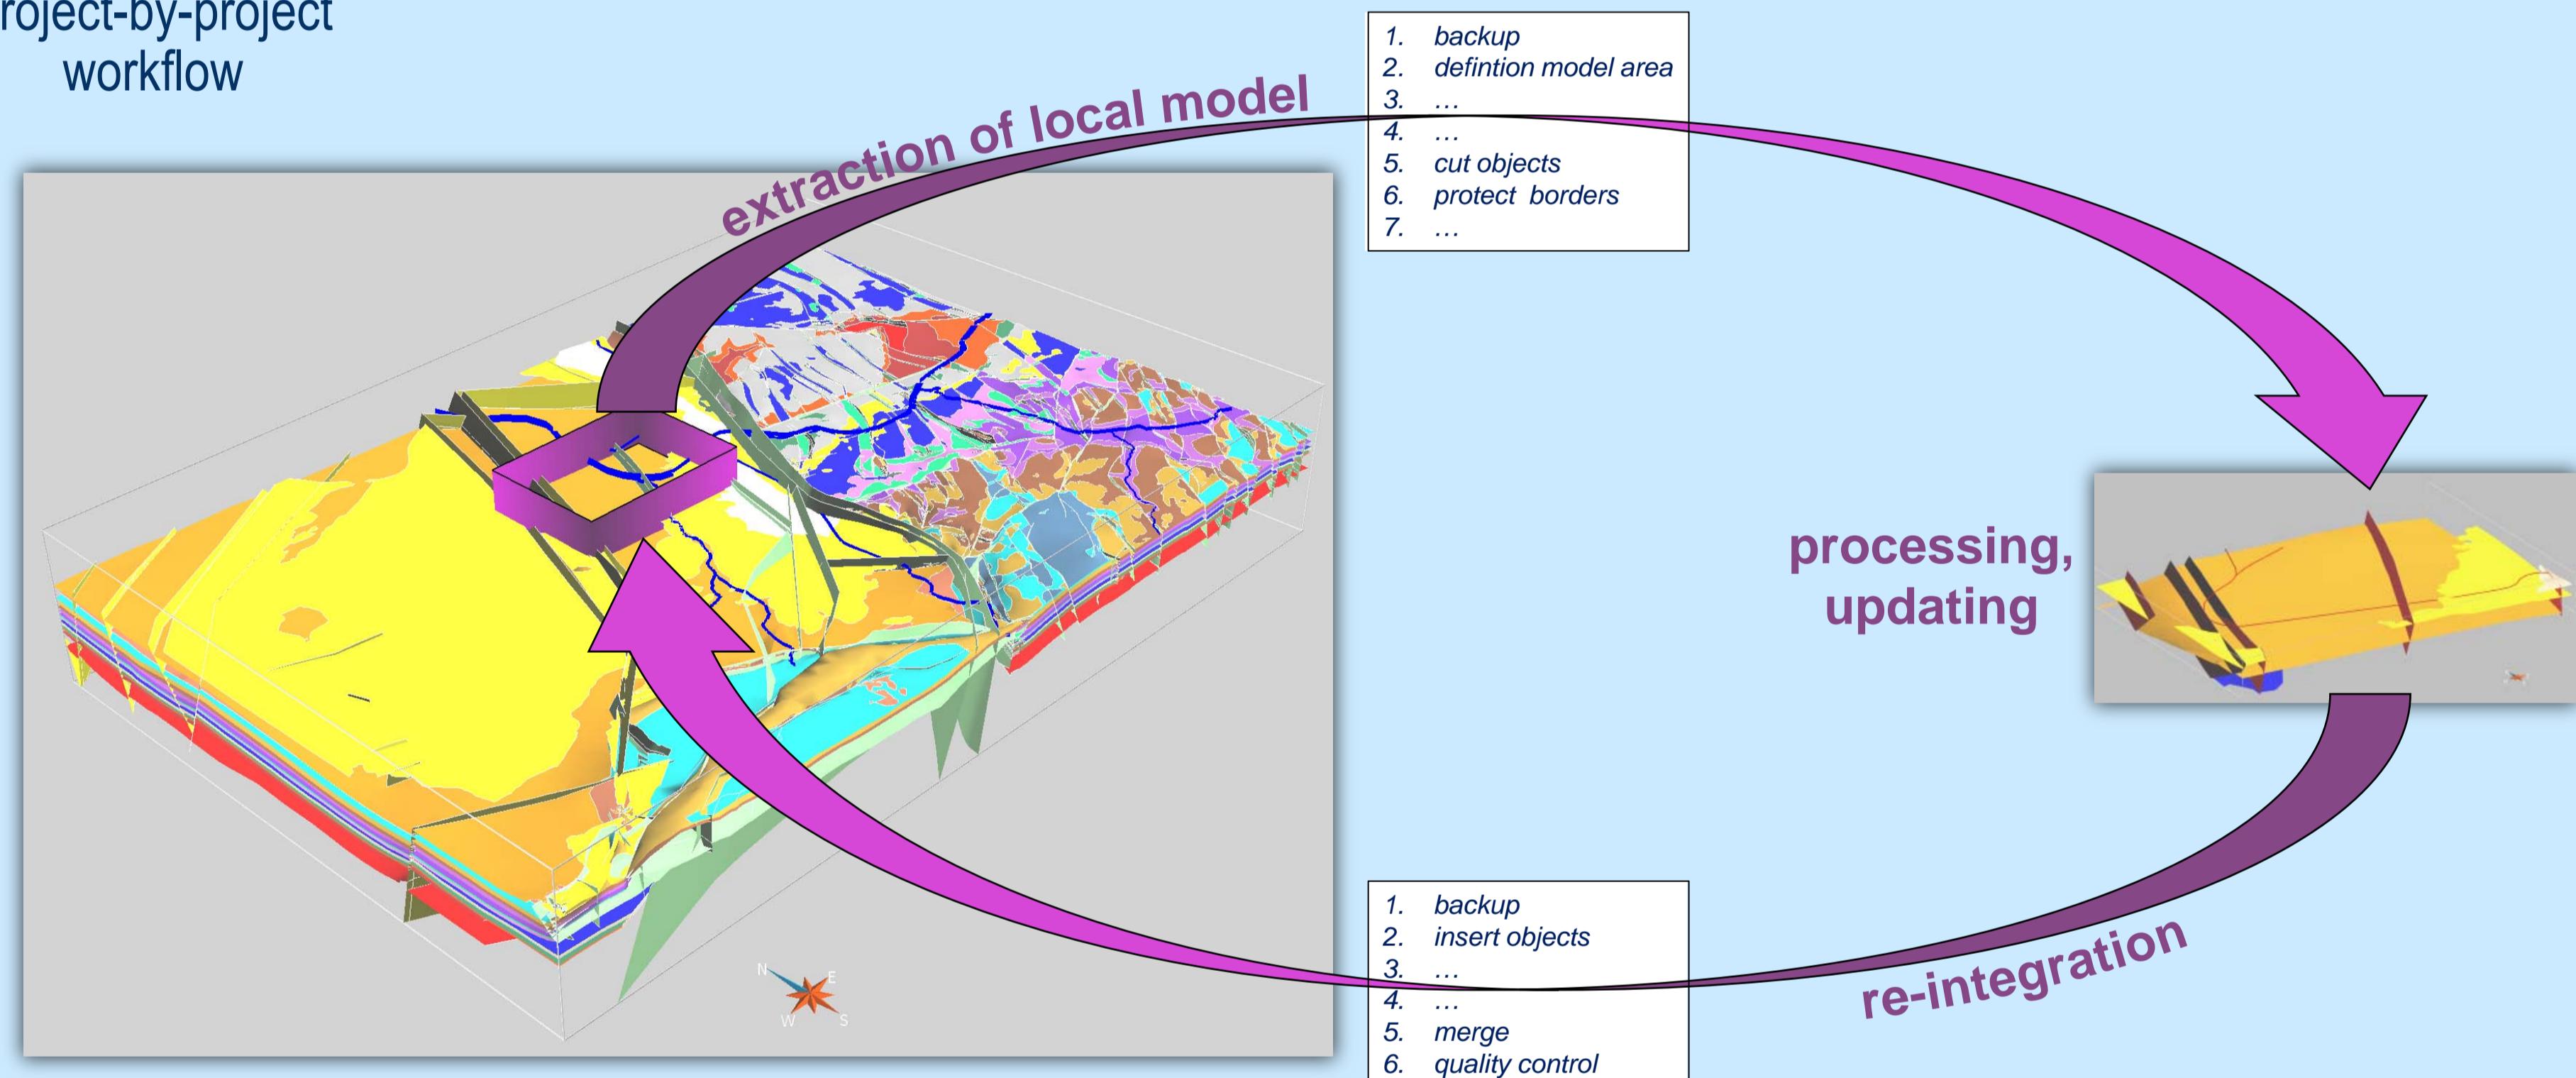

### Usage

Step 1: application of a project - by - project operational workflow

Step 2: model and data maintenance

Model maintenance is time-consuming and expensive. The developed project - by - project operational workflow enables a sustainable use of the "tool".

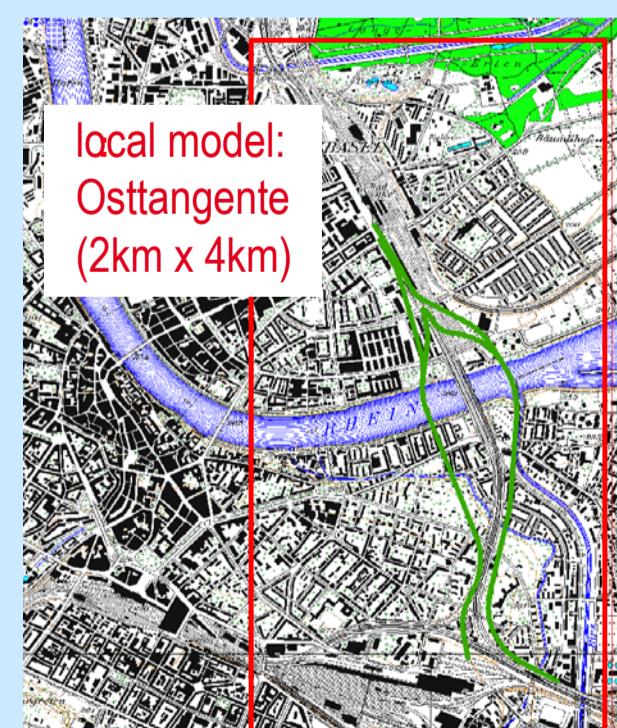

### project-by-project workflow

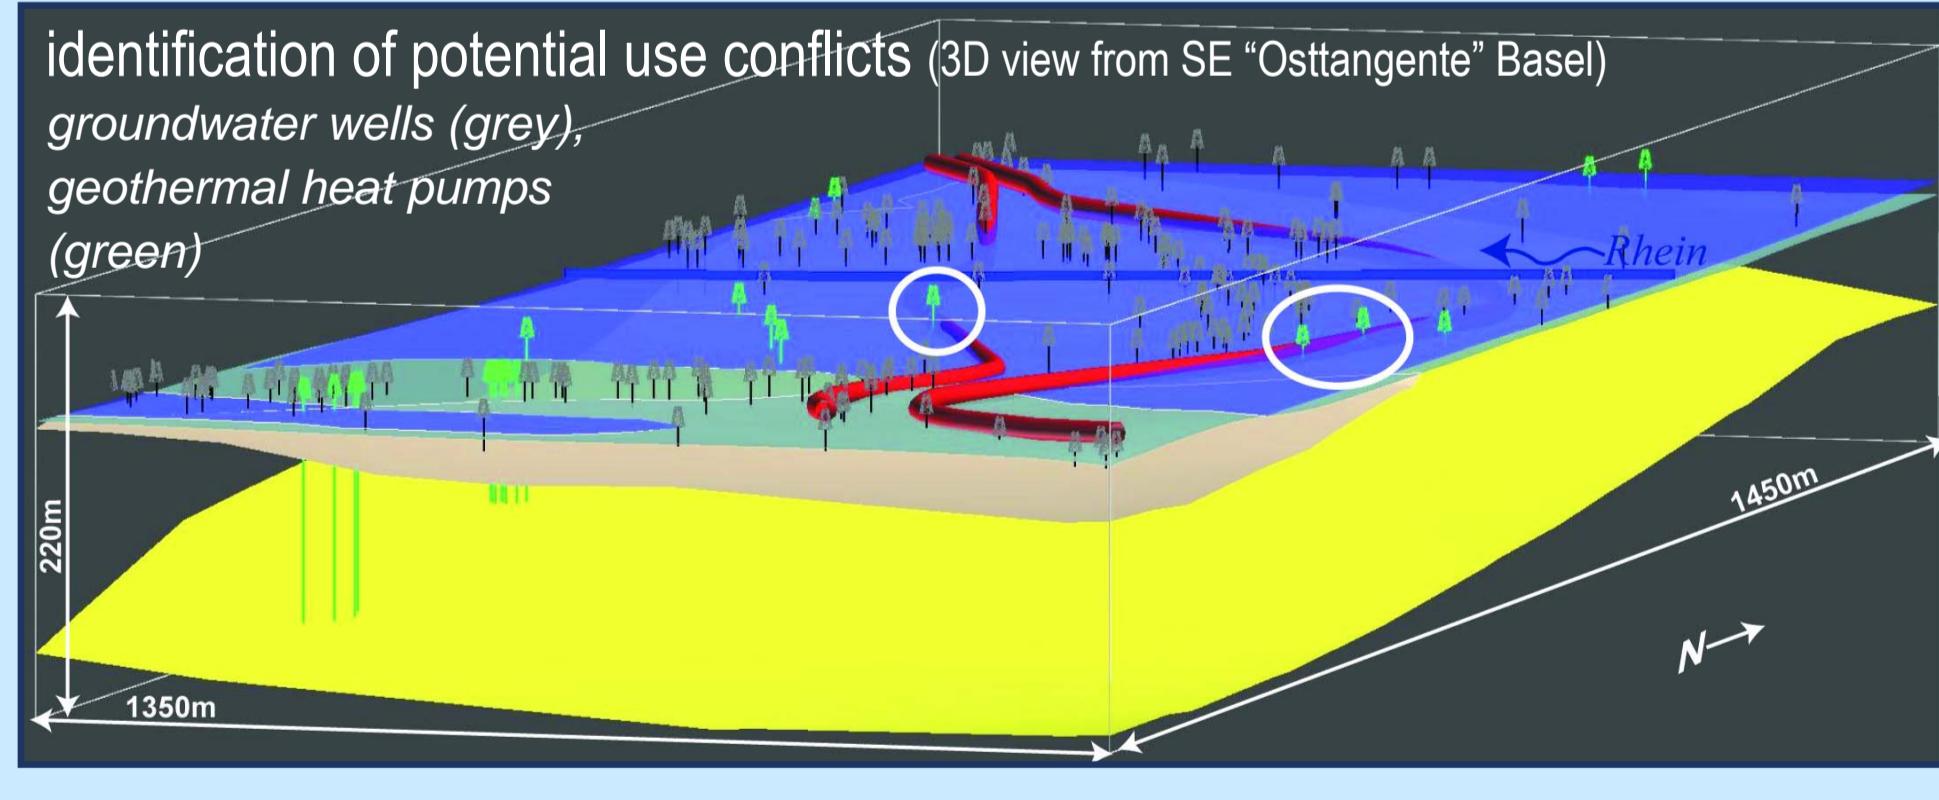

### The tool: 3D model region Basel – case studies

The possibility to generate flexible exports to be able to use the subsurface information in other software applications, as well as to combine hydro-geological information with infrastructural data for a detailed analysis gives rise to repeated requests concerning local issues in the area of Basel.

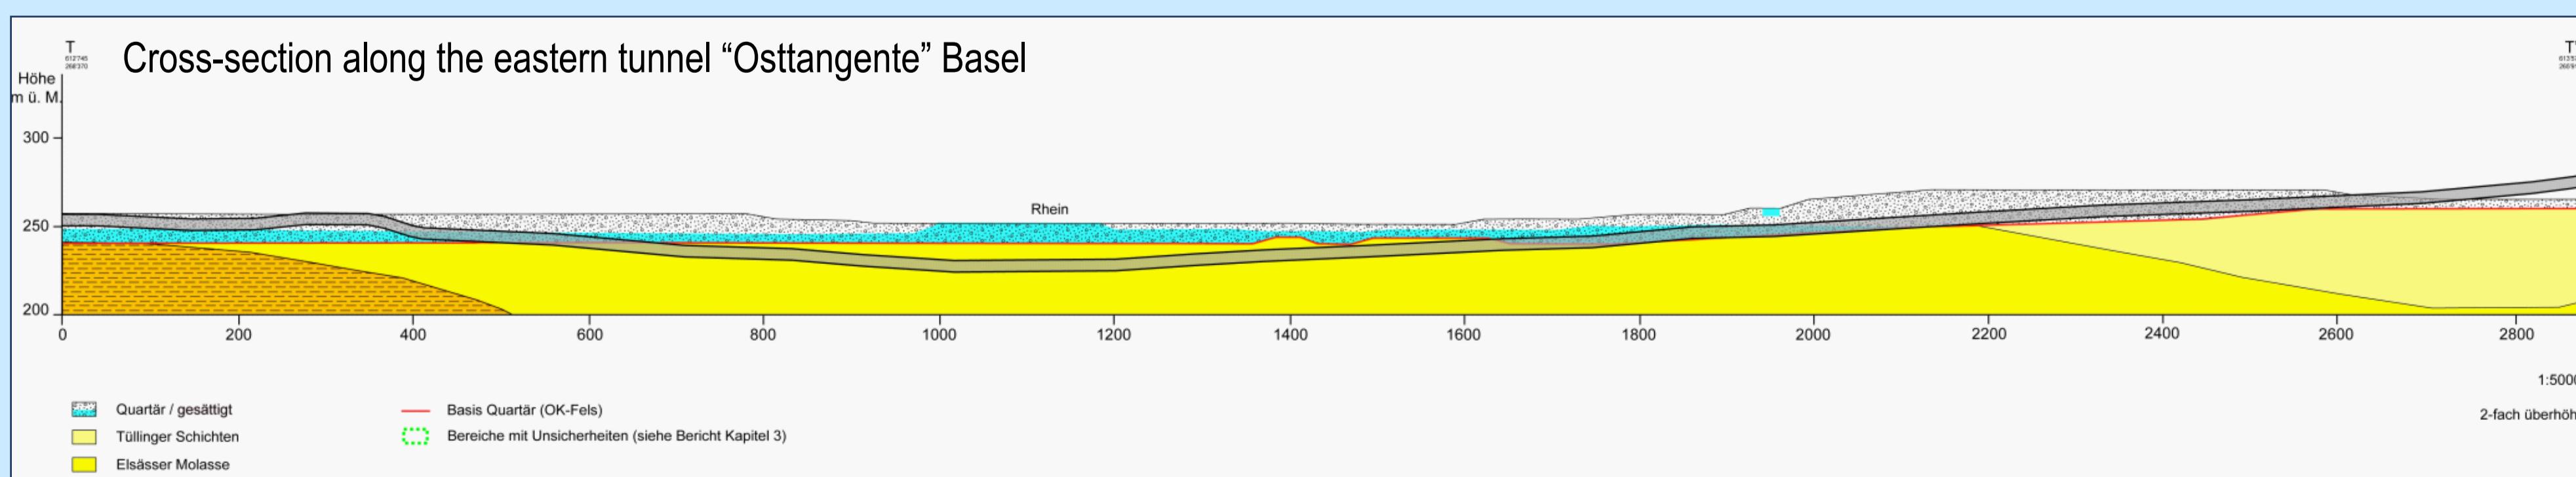

#### First planning steps: highway tunnel below Basel

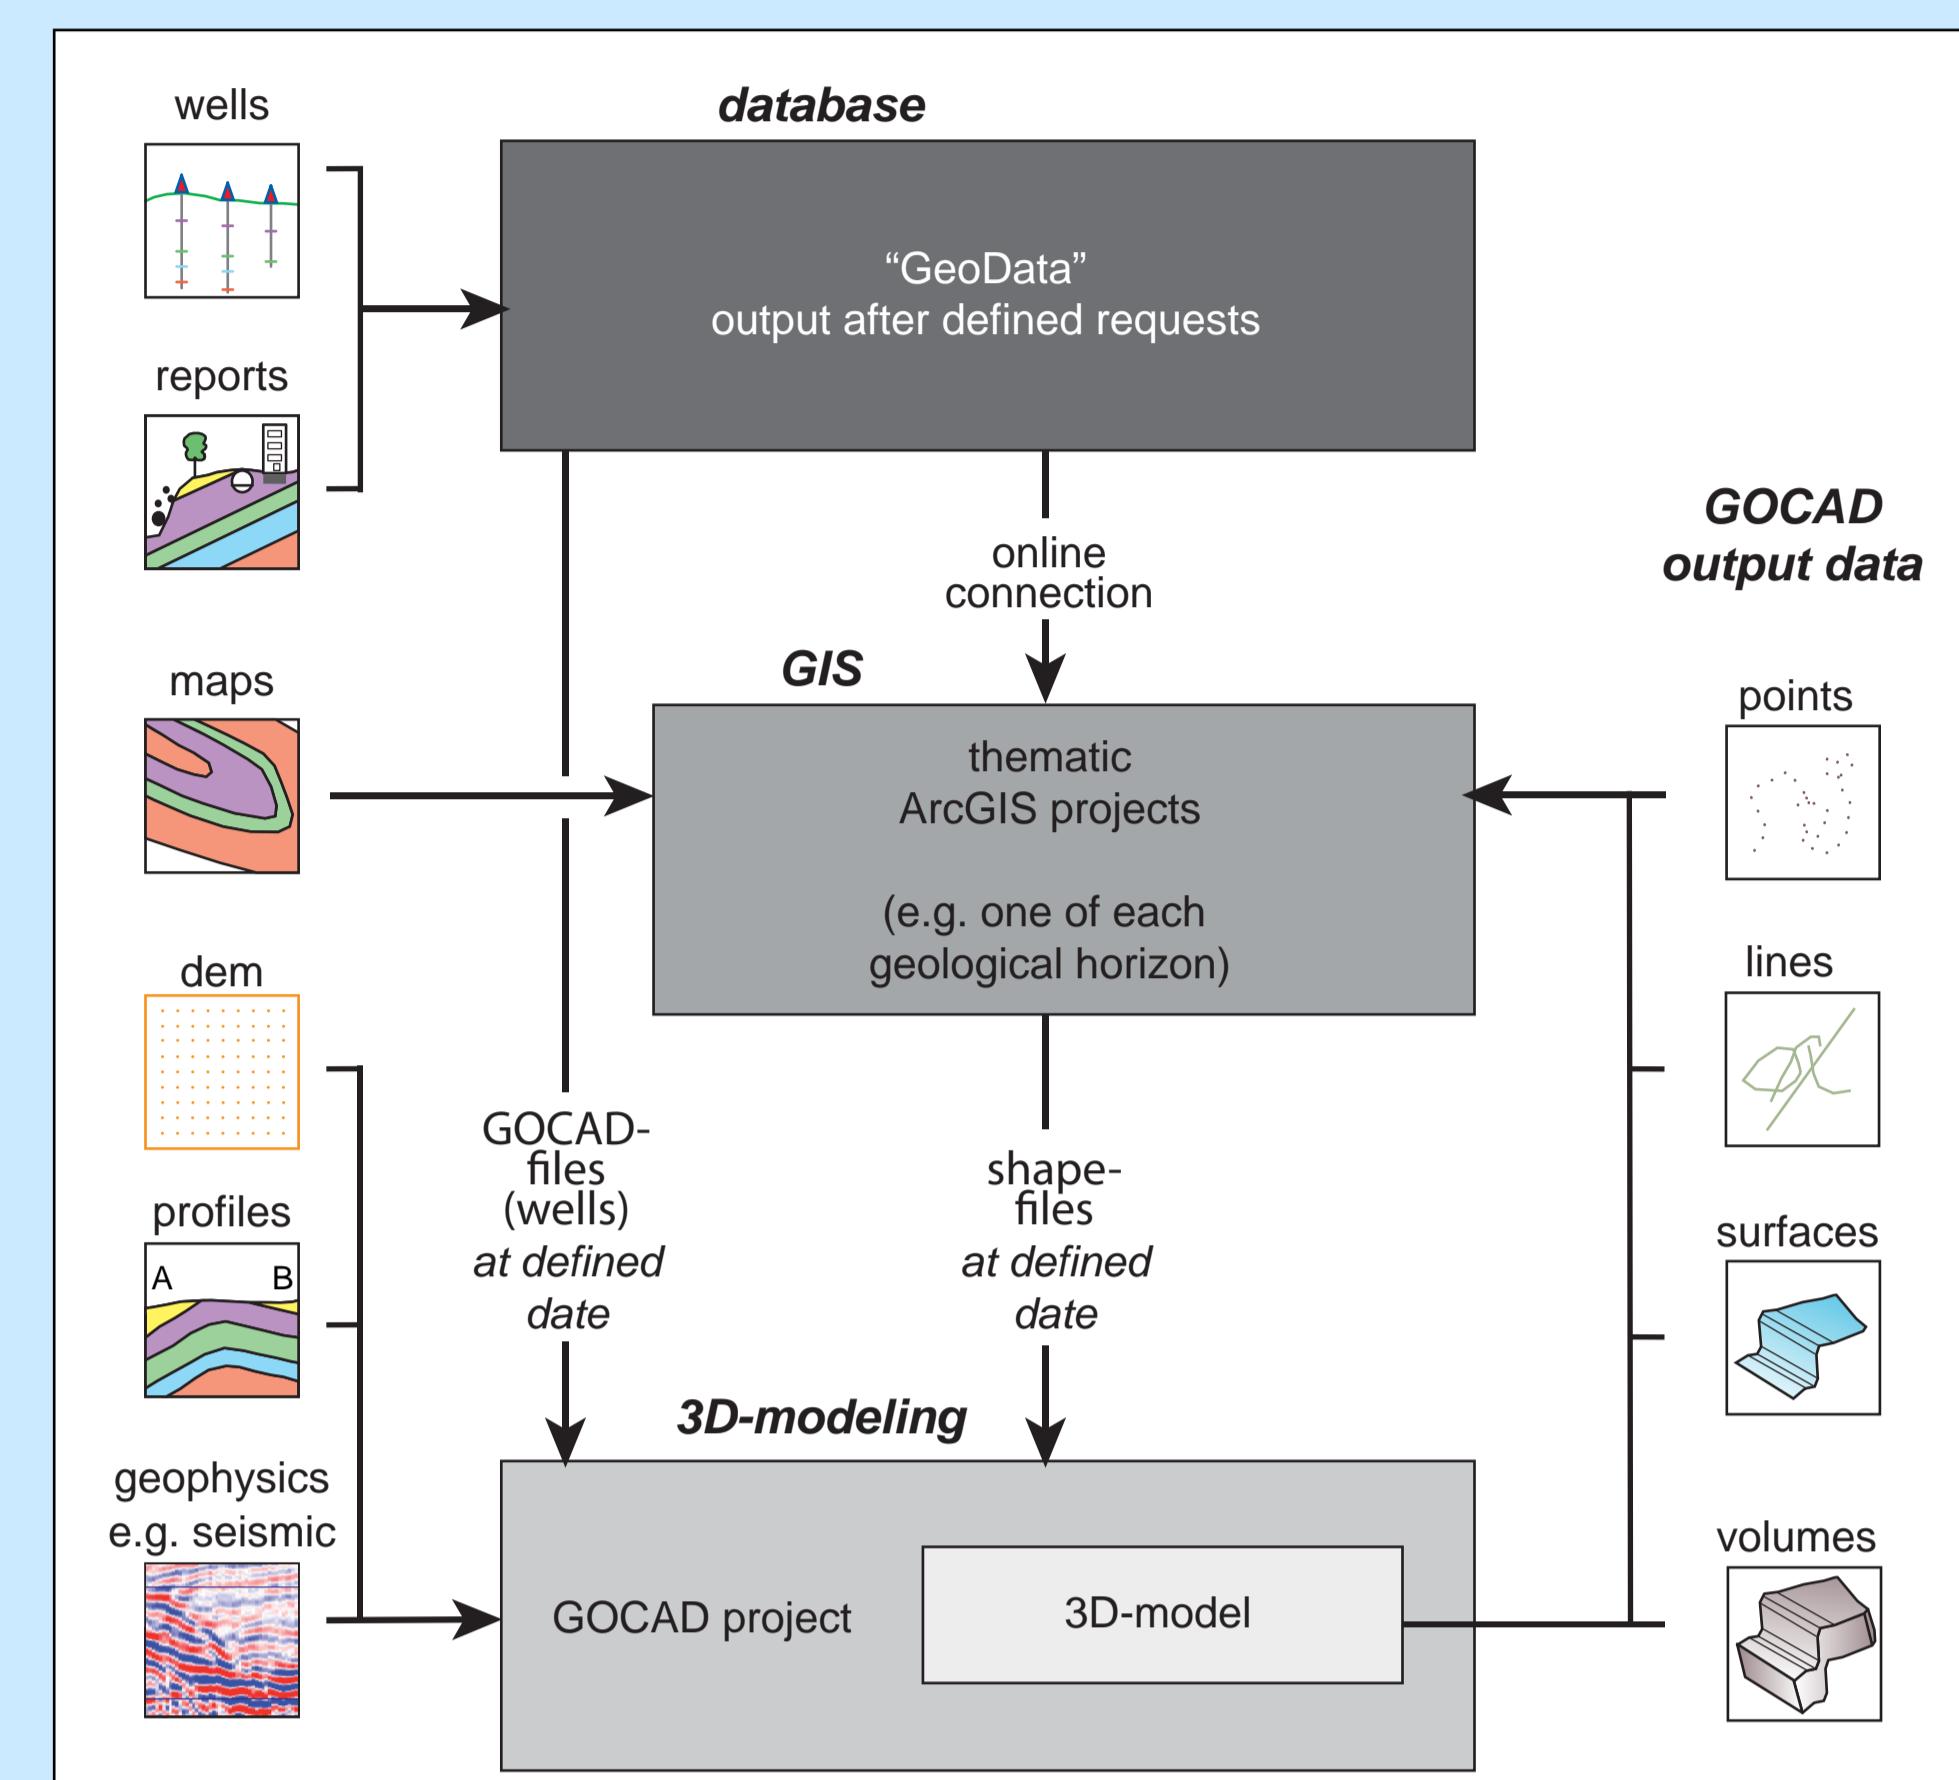

In order to get a quick and substantiated overview on underground condition in a specific area of interest, the Civil Engineering Office (Tiefbauamt, Stadt-Basel) assigned the Applied and Environmental Geology group at the University of Basel to use the tool "geol. 3D model of the Basel region" to describe relevant matters.

- results:
- technical report containing
  - > GIS-analysis (maps),
  - > 3D-analysis
    - 3D views
    - cross-sections
    - maps
  - > description geology
  - > description hydrology
  - > geotechnical matters
    - parameter study
    - risks
  - > identification of use conflicts
  - > groundwater protection

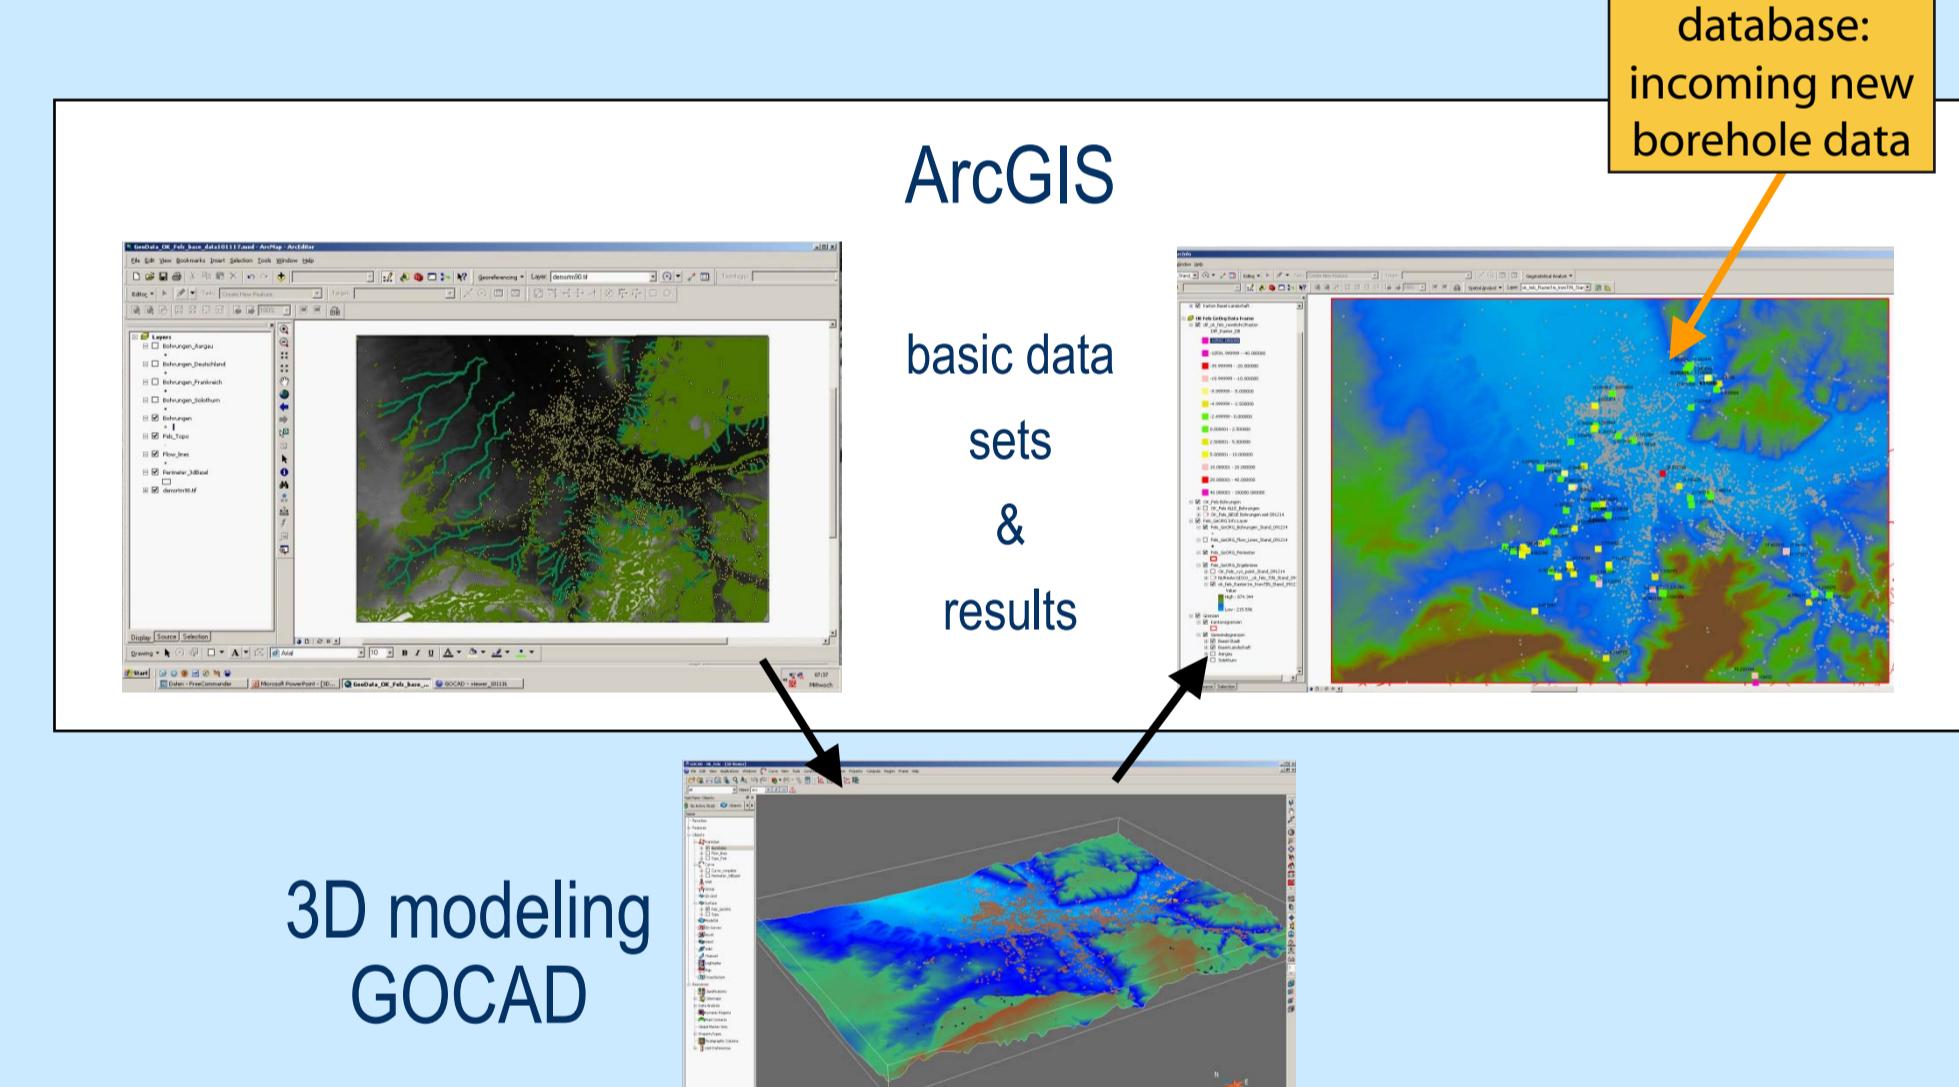

### Datamanagement

Combination of database (boreholes), GIS and 3D-modelling

- easy data exchange,
- fast integration of new data,
- quick views on the model in 2D (maps or sections) and 3D

Horizon-specific GIS-projects contain basic data, the resulting horizon geometries from 3D modeling and new data (e.g. boreholes) which were recently inserted into the database.

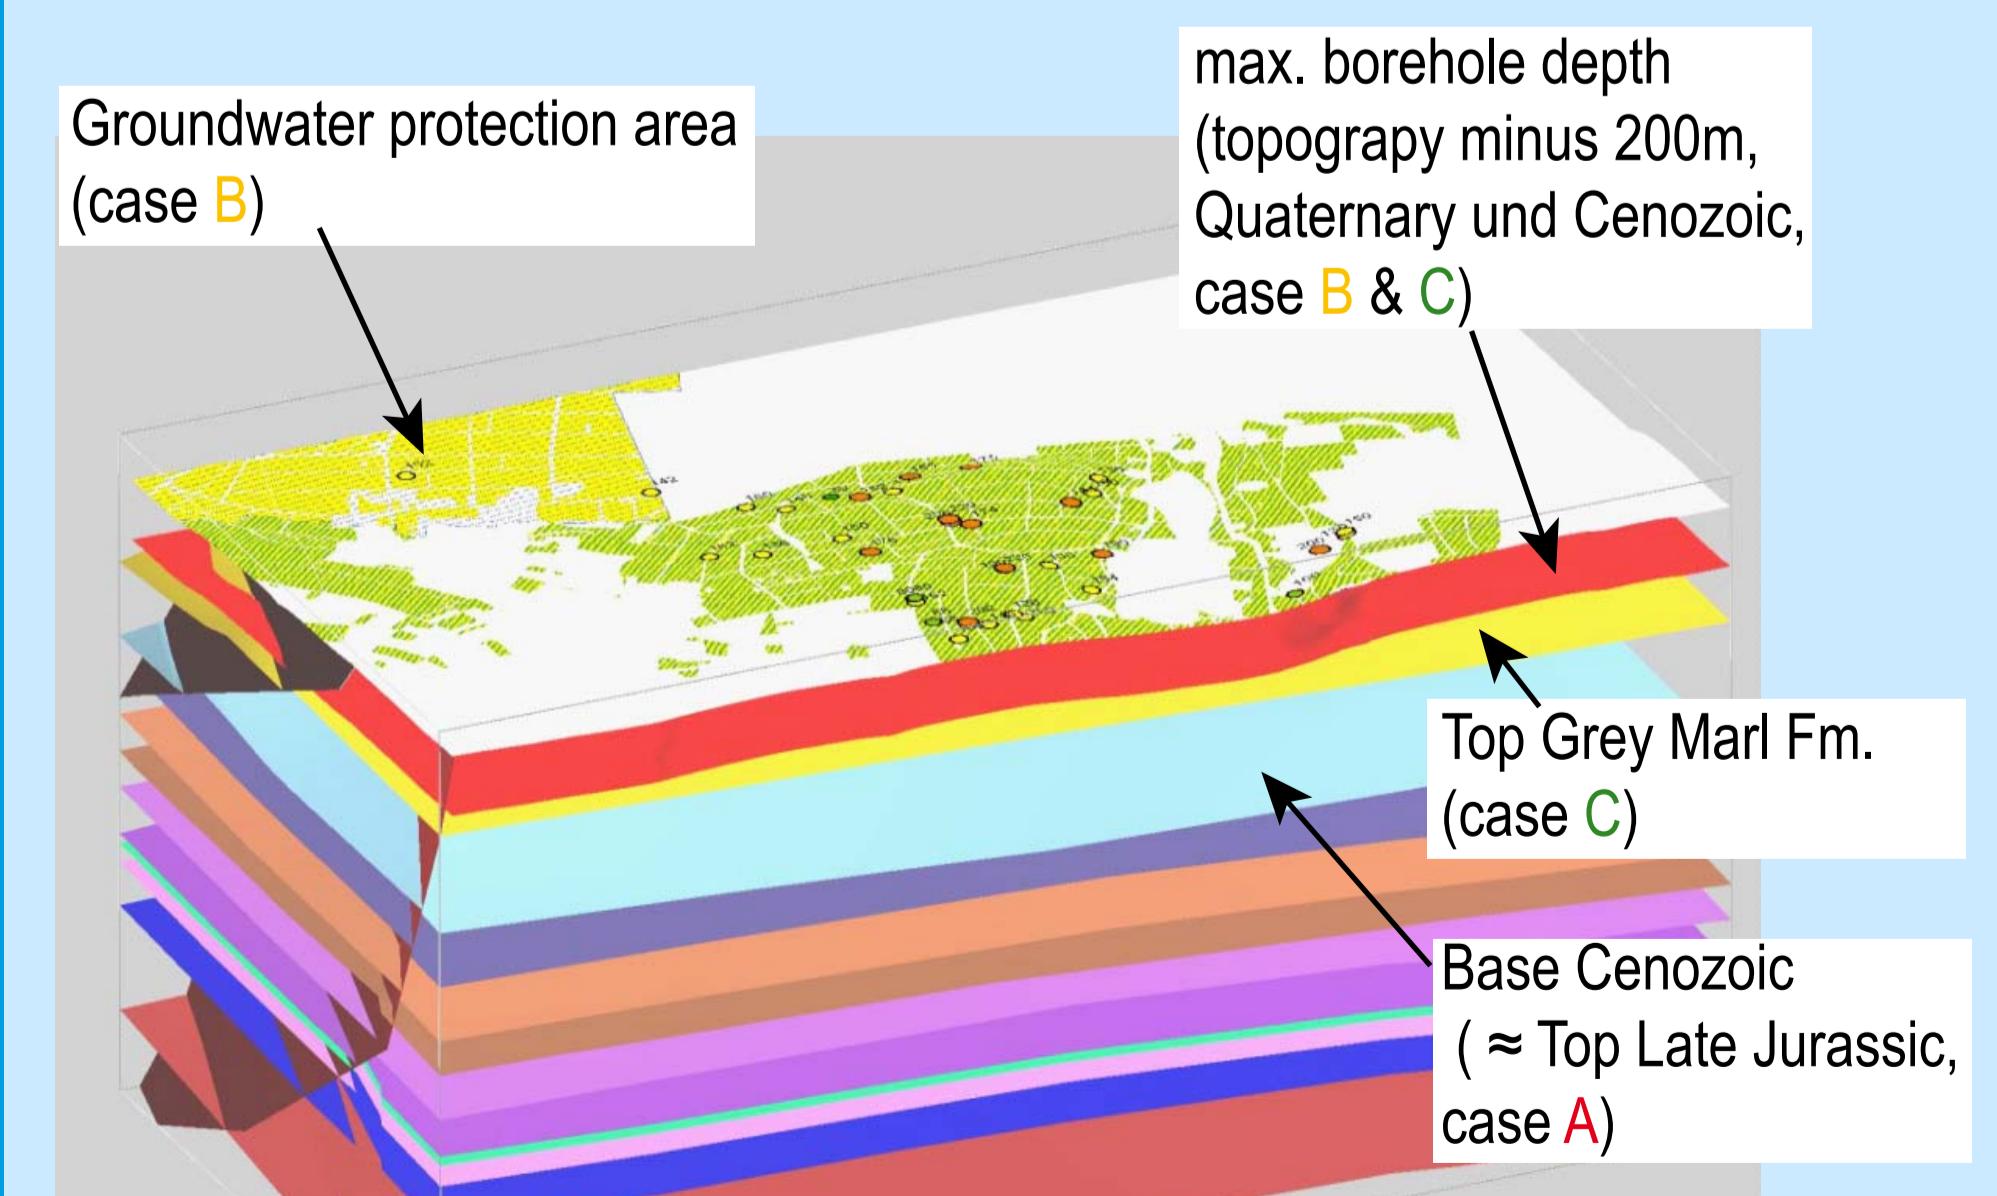

In the GIS-project an automated routine compares new data points with the geometry of already modelled horizons. The computed goodness of fit (differences) could be visualized and helps to assess future issues.

### Concept for the use of shallow (-200m) geothermal energy, Basel-Landschaft (Butscher et al. 2011)

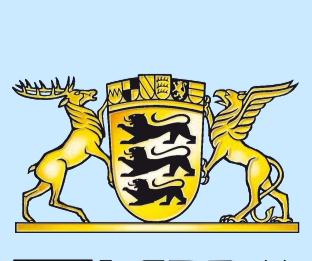

aim:  
establishment of rules for the approval of shallow geothermal energy use (e.g. geothermal heat pumps) up to 200m depth.

development of a classified map adapted from the geol. 3D model

- A = not allowed  
B = allowed with distinct conditions  
C = allowed with standard conditions
